JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

the center and tiers of bleacher-like seats surrounding on all sides. It is used for the various stock-judging courses and there are large classes held there most of the day. English sparrows can be found at all times in the Pavilion. Several places in the arena were scattered with feathers, testifying to the good work of the hawk.

One of the caretakers at the Pavilion stated that the hawk had been staying there for about three weeks.

WALTER A. GOELITZ.

Ravinia, Ill.

RED-BELLIED WOODPECKER AT ATLANTIC, IOWA.

A few days ago a male Red-bellied Woodpecker, *Centurus carolinus*, was observed for the first time in this locality. While it may be possible, of course, that an occasional individual of the species visits western Iowa, careful observation of both summer and winter birds has never revealed one before, and the occurrence may be of interest to other readers. Since first observed, he has appeared every day at our suet bags, affording us ample opportunity to confirm identification, as well as the pleasure of studying his beautiful plumage.

T. H. WHITNEY.

Atlantic, Iowa, April 20th, 1917.

PILEATED WOODPECKER.

A number of articles have appeared within the last year or so regarding this rare bird, all of which relate to counties near us, Ash-
tabula in particular, but I never have seen a note giving report of an instance of its having been seen in Geauga. I have therefore thought it proper to speak a word for our little county.

My own satisfactory views of the birds have been only two, but both of these unmistakable. Both occurred within the limits of Chardon Village, and at the same edge of the same piece of woodland. The first, on March 15th, 1905, was of a mature male, while the second I took to be a young bird, form, size and action being true to the species, but the areas that would be black in the mature bird, though quite dark, were not black. Two others were with me for this observation. It was made May 5th, 1907.

Nearly every year some member of our Bird Club reports seeing one at some point near, and we are coming to consider them not very uncommon.

F. E. Ford and Arthur Fowler, of this place, followed one to a swampy piece of timber about two and a half miles from town, in the township of Claridon, last year, where they saw indications that a pair were getting ready for housekeeping.
